-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM  
THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 07 May 2003.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 24-43 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 24-43 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on \_\_\_\_\_ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

**Priority under 35 U.S.C. §§ 119 and 120**

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

**Attachment(s)**

- 1) ☐ Notice of References Cited (PTO-892) 4) ☐ Interview Summary (PTO-413) Paper No(s). \_\_\_\_\_
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948) 5) ☐ Notice of Informal Patent Application (PTO-152)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) \_\_\_\_\_ 6) ☐ Other: \_\_\_\_\_

**DETAILED ACTION**

***Response to Amendment***

The following action is in response to Amendment C, filed May 7, 2003. Claims 1-23 have been cancelled. Claims 24-43 are newly added.

***Claim Rejections - 35 USC § 112***

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 24-43 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Applicant discloses in independent claims 24, 33 and 43, a first difference and a second difference. Examiner is unclear as to what a first difference and a second difference refer.

Appropriate correction is required.

***Claim Rejections - 35 USC § 103***

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 24-31 and 33-42 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kim et al. (US 6,229,516) in view of Tanioka et al. (US 5,093, 655).

As to independent claims 24 and 33, Kim et al disclose a liquid crystal display (Fig. 2) and a method for driving a liquid crystal display (LCD) having a first gate line block (Fig. 2, items 22,

Art Unit: 2675

upper gate, G1 to Gm) and a second gate line block (Fig. 2, items 24, lower gate, Gm+1 to G2m), the system and the method comprising the steps of;

providing a first pixel voltage to a first pixel electrode formed in the first gate line block (col. 4, lines 4-36); providing a second pixel voltage to a second pixel electrode formed in the second gate line block (col. 4, lines 4-36); providing a common voltage to a common electrode (col. 4, lines 4-36); Kim et al do not disclose pixel voltage. It would have been obvious to one of ordinary skill in the art that Kim et al have the pixel voltage as every liquid crystal display needs pixel voltage in order to function.

providing a first data signal to a first data line formed in the first gate line block (Fig. 2, col. 4, lines 4-36), said first data signal influencing a first difference between the common voltage and the first pixel voltage stored in the first pixel electrode; Kim et al do not disclose a first difference between the common voltage and the first pixel voltage. Tanioka et al disclose in Fig. 1, items 60-70 and col. 4, lines 13-26, where the polarities of the data voltages supplied to the pixels are opposite to each other with respect to the common voltage, thus disclosing where the data signal influences a difference between the common voltage and pixel voltage. It would have been obvious to one of ordinary skill in the art to incorporate the polarity system of Tanioka et al into that of Kim et al. To reverse polarity is advantageous as it reduces flickers of the entire picture face as is disclosed by Tanioka et al in col. 2, lines 43-49.

providing a second data signal to a second data lined formed in the second gate line block (Fig. 2, col. 4, lines 4-36), said second data signal influencing a second difference between the common voltage and the second pixel voltage stored in the second pixel electrode; Kim et al do not disclose a second data signal influencing a second difference between the common voltage

Art Unit: 2675

and the second pixel voltage. Tanioka et al disclose in Fig. 1, items 60-70 and col. 4, lines 13-26, where the polarities of the data voltages supplied to the pixels are opposite to each other with respect to the common voltage, thus disclosing where the data signal influences a difference between the common voltage and pixel voltage. It would have been obvious to one of ordinary skill in the art to incorporate the polarity system of Tanioka et al into that of Kim et al. To reverse polarity is advantageous as it reduces flickers of the entire picture face as is disclosed by Tanioka et al in col. 2, lines 43-49.

and controlling the first data signal and the second data signal to simultaneously increase or decrease the first difference and the second difference (col. 4, lines 4-36).

As to dependent claims 25 and 34, limitations of claims 24 and 33, and further comprising, wherein the first pixel voltage has a first polarity with respect to the common voltage and the second pixel voltage has a second polarity with respect to the common electrode different from the first polarity. Kim et al do not disclose different polarities. Tanioka et al disclose in Fig. 1, items 60-70 and col. 4, lines 13-26, where the polarities of the data voltages supplied to the pixels are opposite to each other with respect to the common voltage. It would have been obvious to one of ordinary skill in the art to incorporate the polarity system of Tanioka et al into that of Kim et al. To reverse polarity is advantageous as it reduces flickers of the entire picture face as is disclosed by Tanioka et al in col. 2, lines 43-49.

As to dependent claims 26 and 35, limitations of claims 25 and 34, and further comprising, wherein the step of controlling the first data signal and the second data signal comprises the step of providing the first data signal of the first polarity and the second data signal of the second polarity to simultaneously increase the first difference and the second difference. Kim et al do

Art Unit: 2675

not disclose different polarities. Tanioka et al disclose in Fig. 1, items 60-70 and col. 4, lines 13-26, where the polarities of the data voltages supplied to the pixels are opposite to each other with respect to the common voltage. It would have been obvious to one of ordinary skill in the art to incorporate the polarity system of Tanioka et al into that of Kim et al. To reverse polarity is advantageous as it reduces flickers of the entire picture face as is disclosed by Tanioka et al in col. 2, lines 43-49.

As to dependent claims 27 and 36, limitations of claims 25 and 34, and further comprising, wherein the step of controlling the first data signal and the second data signal comprises the step of providing the first data signal of the first polarity and the second data signal of the second polarity to simultaneously decrease the first difference and the second difference. Kim et al do not disclose different polarities. Tanioka et al disclose in Fig. 1, items 60-70 and col. 4, lines 13-26, where the polarities of the data voltages supplied to the pixels are opposite to each other with respect to the common voltage. It would have been obvious to one of ordinary skill in the art to incorporate the polarity system of Tanioka et al into that of Kim et al. To reverse polarity is advantageous as it reduces flickers of the entire picture face as is disclosed by Tanioka et al in col. 2, lines 43-49.

As to dependent claims 28 and 37, limitations of claims 24 and 33, and further comprising, wherein the first pixel voltage has a first polarity with respect to the common voltage and the second pixel voltage has the first polarity with respect to the common voltage. Kim et al do not disclose different polarities. Tanioka et al disclose in Fig. 1, items 60-70 and col. 4, lines 13-26, where the polarities of the data voltages supplied to the pixels are opposite to each other with respect to the common voltage. It would have been obvious to one of ordinary skill in the art to

Art Unit: 2675

incorporate the polarity system of Tanioka et al into that of Kim et al. To reverse polarity is advantageous as it reduces flickers of the entire picture face as is disclosed by Tanioka et al in col. 2, lines 43-49.

As to dependent claims 29 and 38, limitations of claim 28 and 37, and further comprising, wherein the step of controlling the first data signal and the second data signal comprises the step of providing the first data signal of the first polarity and the second data signal of the first polarity to simultaneously increase the first difference and the second difference. Kim et al do not disclose different polarities. Tanioka et al disclose in Fig. 1, items 60-70 and col. 4, lines 13-26, where the polarities of the data voltages supplied to the pixels are opposite to each other with respect to the common voltage. It would have been obvious to one of ordinary skill in the art to incorporate the polarity system of Tanioka et al into that of Kim et al. To reverse polarity is advantageous as it reduces flickers of the entire picture face as is disclosed by Tanioka et al in col. 2, lines 43-49.

As to dependent claims 30 and 39, limitations of claims 28 and 37, and further comprising, wherein the step of controlling the first data signal and the second data signal comprises the step of providing the first data signal of the first polarity and the second data signal of the first polarity to simultaneously decrease the first difference and the second difference. Kim et al do not disclose different polarities. Tanioka et al disclose in Fig. 1, items 60-70 and col. 4, lines 13-26, where the polarities of the data voltages supplied to the pixels are opposite to each other with respect to the common voltage. It would have been obvious to one of ordinary skill in the art to incorporate the polarity system of Tanioka et al into that of Kim et al. To reverse polarity is

Art Unit: 2675

advantageous as it reduces flickers of the entire picture face as is disclosed by Tanioka et al in col. 2, lines 43-49.

As to dependent claims 31 and 40, limitations of claims 24 and 33, wherein the first pixel electrode and the second electrode are adjoining each other (Fig. 2, col. 4, lines 4-36).

As to dependent claim 41, limitations of claim 33, and further comprising, wherein a first data driver connected to the first data line for transferring the first data line thereto and a second data driver connected to the second data line for transferring the second data line thereto (Fig. 2, col. 4, lines 4-36).

5. Claims 32 and 43 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kim et al. (US 6,229,516) in view of Tanioka et al. (US 5,093, 655) as applied to claims 24 and 33, above, and further in view of Konoue et al (JP03125187).

As to independent claim 43, limitations of claims 24 and 33, and further comprising, a data driver controlling the first data signal and the second data signal (Fig. 2, items upper and lower frame memory); and a gate driver connected to the plurality of first gate lines (Fig. 2, item 22) and the plurality of second gate lines (Fig. 2, item 24) and scanning the plurality of first gate lines in a first direction and the plurality of second gate lines in a second direction different from the first direction. Kim et al does not disclose where the gate lines are scanned in different directions. Konoue et al disclose a display device and scanning method for a display device, where in Fig. 2a and the Constitution on page 1, the screen is divided into upper and lower parts A and B, where the first scanning direction is opposite to the second scanning direction as shown by the solid arrowed lines. It would have been obvious to one of ordinary skill in the art to combine Kim et al with that of Konoue et al as the system of Konoue et al is shown to improve

Art Unit: 2675

the continuity of an image at the border of each block in a display area and to preclude deterioration in picture quality.

As to dependent claims 32 and 42, limitations of claims 24 and 33, and further comprising, wherein the LCD has more than two gate line blocks. Kim et al do not disclose more than two gate line blocks. Konoue et al disclose in Fig. 2b, A, B and C gate line blocks. It would have been obvious to one of ordinary skill in the art to combine Kim et al with that of Konoue et al as the system of Konoue et al is shown to improve the continuity of an image at the border of each block in a display area and to preclude deterioration in picture quality.

#### ***Response to Arguments***

6. Applicant's arguments with respect to claims 1, 4, 12, 17, 19 and 21 have been considered but are moot in view of the new ground(s) of rejection.

Claims 1-23 have been cancelled. See rejection for new claims 24-43, above.

#### ***Conclusion***

**Any response to this action should be mailed to:**

Commissioner of Patents and Trademarks

Washington, D.C. 20231

**Or faxed to:**

(703) 308-9051, (for formal communications intended for entry)

**Or:**

(703) 308-6606 (for informal or draft communications, please label

Art Unit: 2675

“PROPOSED” or DRAFT”)

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal drive,

Arlington, VA, Sixth Floor (Receptionist)

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Srilakshmi K. Kumar whose telephone number is 703 306 5575.

The examiner can normally be reached on 8:00 am to 4:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner’s supervisor, Steven J. Saras can be reached on 703 305 9720. The fax phone numbers for the organization where this application or proceeding is assigned are 703 872 9314 for regular communications and 703 308 9051 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703 305 4700.
